Problems Necessitating Project Online Planner Integration

Project managers prefer using Project Online because it offers outstanding features, like portfolio visibility and resource planning. However, when it comes to project execution, most teams choose to work with lightweight project and work management systems like Microsoft Planner, which offers a simple and elegant interface for scalable team management initiatives.

Combining these systems allows organizations to manage different tasks in a plan without struggling to manage the whole schedule.
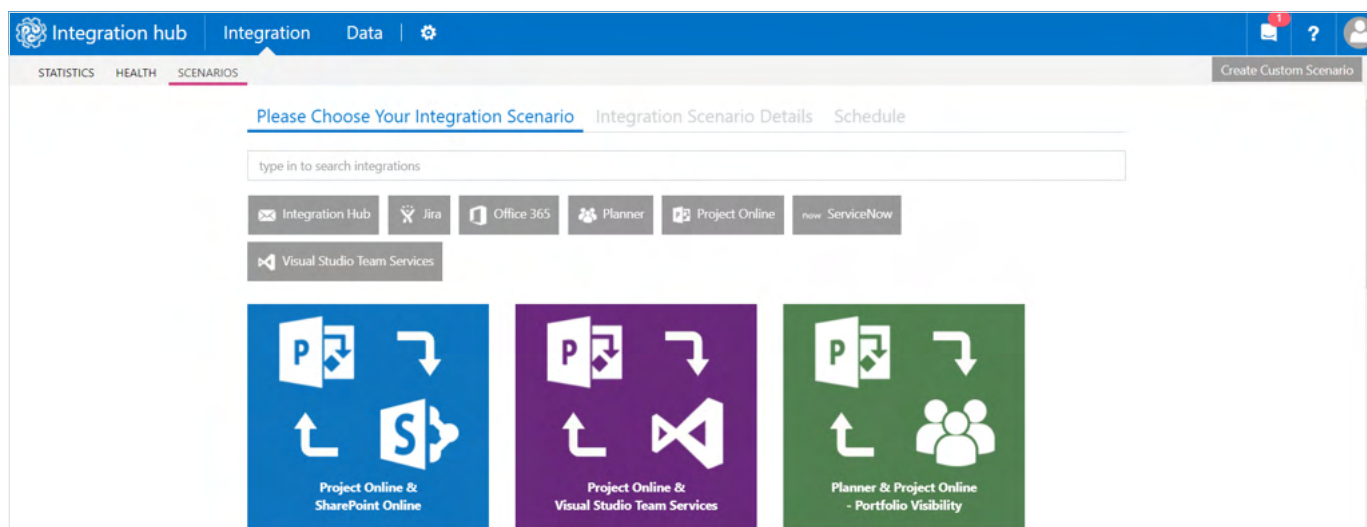

Moreover, linking Planner to Project Online helps to resolve issues such as:

- Planning and organizing projects' workflow efficiently.

- Solving inaccurate resource planning and usage tracking.

- The inability to have immediate portfolio visibility.

- Difficulty accessing project updates and teams completed task statuses in one location.

- Problems with updates from teams and informing teams of new work.

- The challenge of optimizing costs.

Organizations must stick to Microsoft's recommended third-party solutions when initiating Microsoft Project Online Planner integration.

How FluentPro Integration Hub Links Planner and Project Online

FluentPro Integration Hub is a unique third-party software used for connecting project management tools, work management, project portfolio management solutions as well as financial systems. Project managers can use this cloud-based solution to integrate different project management systems seamlessly.

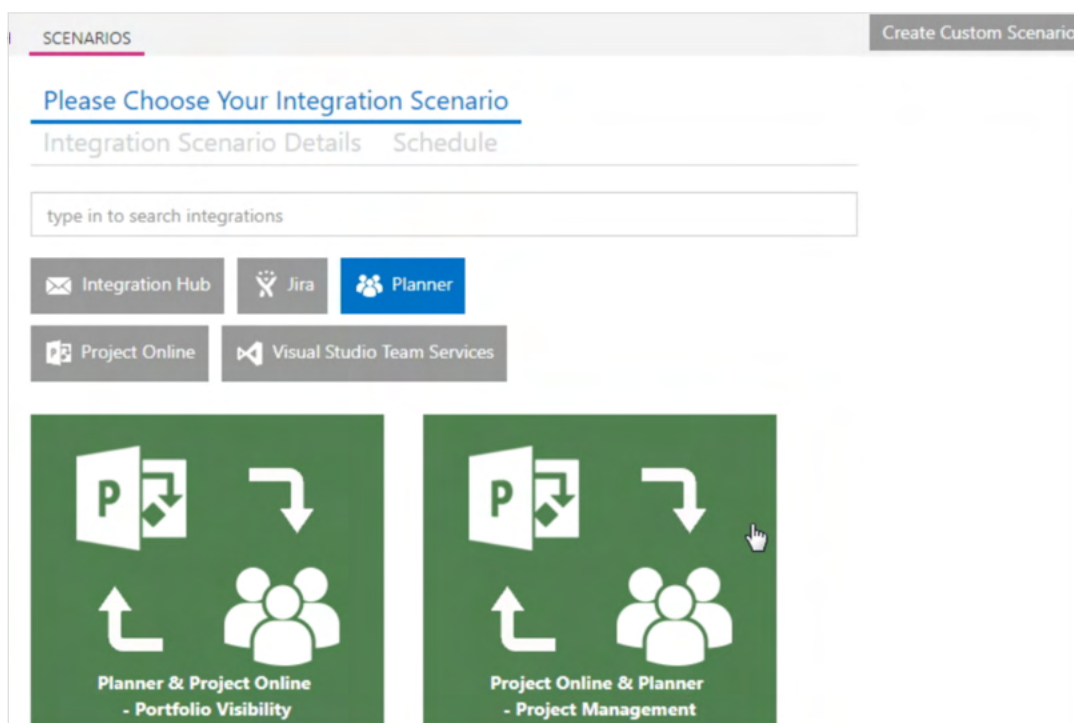

FluentPro integration solution comes with automated data synchronization, enabling project companies to blend agile methodologies and enterprise project management in complex hybrid projects. Once it connects your Project Online and Microsoft Planner systems, your team will regularly receive accurate updates on workflow. It also enables your team to keep working in their project management environment and enjoy automatically synchronized project data via Project Online. At the same time, executives can have an overview of Project Online portfolios without double reporting.

Once installation is complete, FluentPro Integration Hub allows you to set up a one-way or bi-directional integration.

One-way integration enables organizations to connect specific Planner plans from the account to projects from Project Online instance provided during the configuration. This functionality makes it easier for project and portfolio managers to monitor their projects and portfolios on Project Online. Data is automatically transferred from your Planner plans to Project Online based on your configurations.

Project Online Task field		Planner Task field
Task Name	← ▾	Task Name
Start Date	← ▾	Start Date
Finish Date	← ▾	Due Date
Percent Complete	← ▾	Progress
Assignments	← ▾	Assignments
Bucket name	← ▾	Bucket name

Two-way integration allows businesses to publish projects from Project Online into Planner. Once done, teams can work on assigned tasks and give accurate progress reports and updates. All updates flow accurately back to Project Online while updating corresponding project schedules. The bi-directional integration allows project managers to create projects on Project Online but allows their users to use Planner to provide feedback on task progress.
